"TOAR Proteins with substitutions in residues conserved with OmpR
"TOAR proteins with substitution from the cholera toxin promoter.";
J. Bacteriol. 174:6807-6814(1992).
-! FUNCTION: THIS TRANSCRIPTION ACTIVATOR CONTROLS CHOLERA TOXIN,
VIBRIO CHOLERAE. IT BINDS TO THE 5'-TTTGAT-3' TANDEMLY REPEATED
DNA SEQUENCE IN CHOLERA TOXIN PROVICER REGION. TOXS. INTERACTS WITH
THE C-TERMINAL PERIPLASMIC DOMAIN OF TOXR, STIMULATING ITS
ACTIVITY. IT ACTIVATES TRANSCRIPTION AT THE PROMOTERS FOR TCPI AND
TCPA AND THIS IS PRESUMABLY VIA FORT.
-!- STMILARITY: TO B. COLI CADC, AND TO THE C-TERMINI OF A GROUP OF
TRANSCRIPTIONAL ACTIVATORS (OMPR-LIKE PROTEINS).
                                                                                                                                                          Parsot C., Mekalanos J.J.,
"Expression of ToxR, the transcriptional activator of the virulence
factors in Vibrio cholerae, is modulated by the heat shock

General Chem. 277:44195-44201(2002).

Gamma-secretase processed fragment, ALIDI, activates transcription activation through APBBI (Fe65) binding. Couples to JIP signal transduction through C-terminal binding. May interact with cellular G-protein signaling pathways. Can regulate neurite outgrowth through binding pathways. Can regulate neurite cutgrowth through binding to components of the extracellular matrix such as heparin and collagen.

phosphorylated proteins is required for the specific binding of the PID domain. However additional amino acids either N. or C. terminal to the NPXY motif are often required for complete interaction. The NPXY site is also involved in clathrin-mediated

-!- PTM: Proteclytically cleaved by caspases during neuronal apoptosis. Cleaved, in vitro, at Asp-623 by caspase-3 (By endocytosis

-!- PTM: N- and O-glycosylated.
-!- MISCELLANDOUS: Binds zinc and copper in the extracellular domain.
Zinc-binding increases heparin binding. No Cu(II) reducing activity with copper-binding.
-!- SIMILARITY: Belongs to the APP family.

-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUB SPECIFICITY: Hemolymph.
-!- INDUCTION: By introduction of foreign cells into the abdominal
--- INDUCTION: By introduction of foreign cells into the abdominal
--- INDUCTION: By introduction of foreign cells into the abdominal
--- INDUCTION: Calcium is required for lipopolysaccharide binding.
--- SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      July Biol. Chem. 266:13318-13323(1991).
-!- FUNCTION: Participates probably in the elimination of foreign elbstances invading the insect abdominal cavity, and in trapping intracellular symbionts, when they leak from the mycetomes into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ESCUENCE FROM N.A., AND PARTIAL SEQUENCE.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCB). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for carcinoma and malignant hyperplasia. The SCCB oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing cancer comprises detecting stratum corneum chymotrypsin

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PKT) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed carivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbarrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in electronic format directly from NIPO at the printed specification, but was obtained in the contract of the contr

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described and carrier; (2) a kit composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (6) a cell polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a descase associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for a berrant physiclogical interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide, (12) a method for modulation or preventing a pathology associated with the above polypeptide in a method for producing the activity of the polypeptide described above; (13) methods of preacting or preventing a pathology associated with the above polypeptide is useful in manufacturing a medicament for reaging a manufalabetic, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for reaging a pathology associated with the above polypeptide or the nucleic acid molecule may be used to disgnose, treat or prevent metabolic acid molecule may be used to disgnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cancer, and polypeptide associated with a human disease. The polypeptide or paractive present invention.

a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide. NoVX sequences have antidiabetic, anorectic, antibacterial, virucide, immunomodulator, cytostatic, nootropic, neuroprotective, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obestly, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoletic disorders and various dyslipidaemias. The nucleic cands can also be used as hybridiation probes, in chromosome mapping, tissue typing, preventive medicine and proper incorrer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present invention.

Nucleotide sequences encoding stratum corneum chymotryptic enzyme - and related vectors, transformed cells and polypeptides, useful for treating skin disorders, e.g. acne or psoriasis, and for identification of specific inhibitors

Disclosure, Page 97; 137pp; English.

The enzyme encoded by this sequence is used in pharmaceutical, cosmetic and skin care products, especially to treat and prevent acne, xeroderma, or other hyperkeratetic conditions (e.g. callosities or keratosis pilaris), ichthyoses, psoriasis, eczema, etc. It is produced recombinantly following mammal, insect, plant, or microorganism transformation with plasmid p5507. This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide emparate a significant part of a nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a disgnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal phyperkeratosis, acanthosis, epidermal inflammation, dermal inflammation, bruit begidermal hyperkeratosis. The mammal of the invention skin diseases with human stratum corneum chymotryptic enzyme, SCCE transgenic mammals described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

WPI: 2002-643380/69. N-PSDB; ABQ76226 Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

Claim 10; Page 58-59; 74pp; English.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence of coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant; operably linked to a promoter that drives expression of heterologous sccor its variant in skin. The product of the invention is useful as a model or ameliorate a pathogenic condition, for development, to relieve or ameliorate a pathogenic condition, for development or testing of a composition affective for the prevention or treatment of an exportant or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an exportant or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an exportant or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an exportance at a topic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. Phe mammal of the invention is also useful or sa model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCE which is a serine protease synonymous with human kallikrein 7 (KLK7) and is used in the development of the

Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory Caenepeel Sudarsanam S, Manning G, Whyte D, WPI; 2002-139913/18. N-PSDB; ABK31782. Plowman G, W

Claim 6; Fig 2N; 313pp; English.

The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, cloun, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asbhma), cardiovascular diseases (e.g. inflammatory diseases and asbhma), brain or neuronal-associated diseases, metabolic coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. disorders) conformatorial aspociated disorders, confiction sexual dysfunction, mood disorders, attention disorders, neurological disorders (e.g. Alzhehmer's disease, Parkinson's disease) and dyskinesias. The nucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. glaucoma) and macular degeneration. AAU82702-AAU82760 represent the novel human proteases of the invention

Novel genes which are differentially regulated in prostate cancer, used for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 293-294; 416pp; English.

prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves certaining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined.

(I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells which involves contacting a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of a prostate cancer cells with a test agent under conditions effective for is useful as molecular markers, as drug targers, and for detecting, preventing or treating, determining predisposition to diseases and conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of conditions especially relating to prostate cancer. (I) and its stage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus considering apprications to treat prostate cancer. The identification of prostate cancer. The identification of searching to prostate cancer. The identification of the polypeptide of genes, and groups of genes, any argumes of genes, and groups of genes. of specific genes, and groups of genes, expressed in pathways physiologically relevant to prostate cancer permits the definition of functional and disease pathways and the delineation of targets in these pathways which are useful in disquostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein diferentially applications. This is the am regulated in prostate cancer

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves intervention in a subject having a prostate cancer, which involves carget genes which are differentially-regulated in prostate cancer. Freferably, the expression levels in a sample comprising prostate tissue of tracet genes which are differentially-regulated in prostate cancer. Freferably, the expression levels of at least 10 genes are determined. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated activity of activity of a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (I) is useful for sasessing, monitoring, prognosticating, preventing, attaing, assessing, monitoring, prognostication, of diseases and conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer e.g., in tissue sections, in biopsy sample, in total RNA, in lymph, in blood cate. (I) is useful for assessing cancer e.g., to determine the type of cancer, its stage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have a use in gene therapy, and in a vaccine. The composition and methods are useful in diagnosing and/or treating cancer, particularly ovarian cancer. The composition may also be used as a vaccine to prevent cancer. The present sequence is used in the exemplification of the invention
for searching specific binding partners of the polypeptide. (I) is useful in therapeutic applications to treat prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways physiologically relevant to prostate cancer permits the definition of functional and disease pathways and the delineation of targets in these applications. This is the amino acid sequence of a protein differentially regulated in prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotide and polypeptide useful for diagnosing and/or treating cancer, particularly ovarian cancer, and as a vaccine.

The present sequence is human stratum corneum chymotryptic enzyne (HSCEE), a member of the kallikrein multi-gene family. Kallikreins and Kallikrein-like protease enzyme kallikrein-like protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding Kallikrein-like proteins KKLII, KLK-LZ, KLK-LI, KLK-LY, KKK-LS, and KLK-LG have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New kallikrein-like (XLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human stratum corneum chymotrypsin enzyme peptide #3 (residues 5-13).
                                                  Human, KLK-L1, KLK-L2, KLK-L3, KLK-L5, KLK-L5, KLK-L6, HSCEE,
human stratum corneum chymotryptic enzyme, kallikrein-like protein,
serine protease, cytostatic, cancer, prostrate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             100.0%; Score 40; DB 3; Length 257; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a blological sample from the patient with a polynucleotide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 nucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, and as vaccines. This sequence corresponds to one of the proteins used for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.

Diagnosing cancer comprises detecting stratum corneum chymotrypsin enzyme.

Claim 25; Page 102; 127pp; English.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proceases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                               March 1, 2004, 17:21:46; Search time 11.8889 Seconds (Without alignments) 39.081 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 116

; Sequence 35. Application US/09918243
; Patent No. 6627403
; GARERAL INFORMATION:
APPLICANT: O'Brien, Timothy J.
APPLICANT: Cannon, Martin J.
APPLICANT: Satin, Alessandro
TITLE OF INVENTION: Methods for the early diagnosis of ovarian cancer;
FILE PREPERENCE: D6223GIP/C/D/CIP
CURRENT APPLICATION NUMBER: US/09/918,243
; CURRENT APPLICATION NUMBER: US
CURRENT APPLICATION NUMBER: US
RIOR APPLICATION NUMBER: US

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Inchem. Biophys. Res. Commun. 224, 746-751, 1996
Title: HTF: A b-zip transcription factor that is closely related to the human XBP/TREE
Reference number: JC4857
Accession: JC4857
Molecule type: mRNA
Residues: 1-267 < KIS>
Comment: This is a basic-leucine zipper type transcription factor involved in hepatoce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       robele transcription factor MYB41 [imported] - Arabidopsis thaliana
| Species: Arabidopsis thaliana (mouse-ear cress)

           This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the FNEL outstation the Buropean Bloinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-1-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to infiammarcry cytokines.

TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and kidney.

SIMILARITY: Belongs to peptidase family S1. Kallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CHARGE RELAY SYSTEM (BY SIMILARITY).

"Cloning and expression of the cutinase A gene of Botrytis cinerea.";
Mol. Plant Microbe Interact. 10.21-29/1997).
-!-FUNCTION: Catalyzes the hydrolysis of cutin, a polyester that forms the structure of plant cuticle. Allows pathogenic fungi to penetrace through the cuticular barrier into the host plant during the initial stage of the fungal infection (By similarity).
-!-CATALYTIC ACTIVITY: Cutin + H(2)0 = cutin monomers.
-!-SUBCELLULAR LOCATION: Secreted (By similarity).
-!-THM: The 2 disulfide bonds play a critical role in holding the catalytic residues in luxta-position; reduction of the disulfide bridges results in the complete inactivation of the enzyme (By

Natl. Acd. Sci. U.S.A. 89:5877-5881(1992).

-!- FUNCTION: Brings about phosphorylation of specific threonines in the heavy chains of myosin during chemotaxis, which results in inhibition of myosin thick filament formation. Phosphorylation also inhibits the actin-activated ATPase activity of myosin.

-!- CATALYTIC ACTIVITY: ATP + [myosin heavy-chain] = ADP + [myosin heavy-chain] phosphate.

-!- SUBCELLUAR LOCATION: Membrane-bound.

-!- DEVELOPMENTAL STAGE: Expressed only during development.

-!- SIMILARITY: Belongs to the eukaryotic diacylglycerol kinase
                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                          MEDLINE=92335200; PubMed=1321427;
Ravid S., Spudich J.A.;
"Membrane-bound Dictyostelium myosin heavy chain kinase: a
developmentally regulated substrate-specific member of the protein
kinase C family.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        -!- SIMILARITY: Contains 2 zinc-dependent phorbol-ester and DAG binding domains.
-!- CAUTION: While this is experimentally defined to be a protein kinase, it could be, on the basis of sequence similarities, a diacylglycerol kinase.
